1.0 Executive Summary

This Security Guide was developed by New Boundary Technologies to provide insight and recommended security configurations for security officers and network administrators charged with locking down their Windows XP client workstations. Securing information technology assets is a critical operational function that drives tangible business benefits. The goal of IT security is to protect confidential and proprietary information, intellectual property, and infrastructure assets that contribute to organizational productivity, revenue generation, and brand integrity.

Several organizations, including Microsoft, the National Security Agency (NSA), and the National Institute of Standards and Technology (NIST), offer guidance on securing Windows XP workstations within a variety of environments. The guidance offered by these organizations is based on consensus best practices for Windows client PC security. While perimeter defense measures remain an integral component of network security, many IT security experts and organizations have concluded that system lockdown now represents a primary opportunity for enhancing the overall security state of a network. This is especially true for organizations with heightened security requirements resulting from the nature of their organizational charter, such as government, intelligence, and military organizations, as well as enterprises with increased security concerns resulting from regulatory compliance requirements.

While system lockdown is not a new concept, it has always been an extremely time-consuming manual process, especially in a heterogeneous environment, because of the wide variety of different client PC configurations involved. Until the advent of Policy Commander™, there was no way to easily target individual computers or groups of computers based on configuration traits. Using Policy Commander, administrators can now implement security policies that lock down client PCs based on virtually any configuration trait, from operating system and service pack level to Windows services and even specific registry settings. For the first time, network and desktop administrators now have an automated solution that empowers them to quickly and easily implement security best practices for Windows XP via security policy enforcement and dynamic configuration management.

This guide is based upon the NIST High Security Level (which has recently has been renamed as Specialized Security-Limited Functionality) recommendations from the National Institute of Standards and Technology Special Publication 800-68, *Guidance for Securing Microsoft Windows XP Systems for IT Professionals: A NIST Security Configuration Checklist*. The complete version of 800-68 is available from NIST at: <http://csrc.nist.gov/>

2.0 Proactive Approach to Security Configuration Management

Recently there has been an increased interest in “locking down” end user workstations. This renewed interest is being driven to a large extent by the regulatory compliance requirements of laws that have been passed by the U.S. Congress, various state legislatures, and the European Union over the last few years. The Sarbanes-Oxley Act of 2002 (SOX), The Health Insurance Portability and Accountability Act of 1996 (HIPAA), The Gramm-Leach-Bliley Act (GLBA), California Bill SB 1386, and the European Union Data Protection Directive are just a few of the laws and regulations that require corporations and other covered organizations to protect sensitive financial and customer information or suffer financial and legal penalties as a consequence. In fact, many regulatory auditors responsible for conducting audits for compliance are recommending that corporate systems be locked down.

Locking down systems means that the user has no Administrator or Power User Rights within Windows XP and involves applying one of the High Security templates that have been developed over the years by NIST, NSA, DISA and Microsoft. Locking down systems is a proactive way to combat the increasing threats from viruses, Trojan horses, and hidden root kits that exploit the security vulnerabilities exposed when a system has Administrator rights.

According to NIST, when a computer security configuration template (e.g., hardening or lockdown guide) is applied to a system, in combination with trained system administrators and a sound and effective security program, a substantial reduction in vulnerability exposure can be achieved. In fact, actual testing by the NSA and NIST of these templates on workstations and servers has shown that they will reduce the vulnerabilities on systems by 80 to 90 percent. More recent testing by eWeek Labs shows that locking down a system running Windows XP SP2 to just “User Rights,” showed no infections after visiting five websites known to install malware. Those same systems, with elevated rights to Administrator or Power User, experienced 16 infections each.

2.1 Eliminating Configuration Vulnerabilities

The security approach for workstations over the last few years has been to buy the standard anti-virus, patch management and spyware tools and develop the IT processes to use them. While necessary, these tools are reactive measures to the threats posed by malicious software. When you look at the results of the template testing from NIST and the NSA, these tools essentially only cover 10 to 20 percent of the vulnerabilities on your systems. They do not treat the underlying vulnerabilities exploited by malicious software, which is the result of a system that is not properly configured or locked down.

Viruses and other forms of malware exploit the software defects in operating systems and applications, improper configurations, or rights allowed on the operating system and user interaction. Those tools are not designed to correct problems in configuration areas of the operating system such as insecure accounts, unnecessary services, file permissions, or registry settings. Thus if you are going to lock down a system, and address the remaining 80 to 90 percent of your system vulnerabilities, then this is the area you will need to address.

2.2 Lockdown Issues

If locking down systems is a proven way to increase the security of your workstations, then why hasn't it been more widely adopted? There are a number of reasons for the lack of widespread use of system lockdown. Aside from it not being popular with users who have had Administrator rights on their systems, the number one reason is that applying any lockdown security template can be a complex and time-consuming task that sometimes requires the use of numerous complex and separate tools for workstations and servers. In addition, locking down a workstation without thorough testing can cause unexpected interruptions in availability of applications and network resources. This can lead to productivity losses throughout the organization as end-users become unable to access mission critical applications or network resources.

Furthermore, once a system was locked down with a template or security baseline configuration, it was extremely hard to: 1) Detect when a system became unlocked or non-compliant and 2) When non-compliance was discovered, it was a manual process to remediate the system and bring it back into compliance. For these reasons network administrators tended to avoid applying the lockdown templates to their systems and thus have missed an opportunity to eliminate up to 90 percent of their systems vulnerabilities.

If you plan to lock down systems it is recommended that a multi-faceted approach be taken. You will still need good anti-virus, anti-spyware, firewall, VPN, patch management and software distribution solutions and the right framework and processes that will allow you to handle users' issues in a locked down environment. However, to eliminate the inherent vulnerabilities in default Windows XP configurations and implement proactive security configuration best practices, you will also need a good security policy management solution which automates and streamlines policy implementation, monitoring and enforcement.

2.3 Policy Commander Approach

To address the need for a robust, easy to use security policy management solution, New Boundary Technologies developed Policy Commander™. Policy Commander eliminates the complexity of customizing, deploying, managing and maintaining security configurations and policies on desktops and servers. Policy Commander is a *single solution* that includes a growing library of proven best practices security policies that can be applied to both workstations and servers.

Policy Commander eliminates the need to learn how to use separate tools and scripting languages for different versions of Windows workstations and servers. The full NIST templates, especially those with more stringent security settings, can be challenging to implement and enforce without adversely affecting connectivity and application availability, and therefore require extensive testing. While Policy Commander includes policies based on the full NIST templates, in order to streamline testing requirements and provide a more granular security configuration methodology, we have also modularized the NIST templates into sets of Policy Commander security policies that are much easier to test, implement, and manage. New Boundary Technologies recommends that administrators assign and enforce the security policy modules derived from the NIST

templates to incrementally harden a computer's security configuration, rather than assigning and enforcing the security policies based on the full NIST security templates. Incremental or granular hardening will significantly reduce the amount of time and effort required to test settings and their impact on applications and network connectivity, and minimize any loss of productivity with the organization.

Policy Commander is unique in its ability to precisely target security policies to the appropriate computers, which dramatically reduces the time and effort required to deploy security policies. Policy Commander is designed to continuously monitor the configuration state of computers and security policies, notify administrators of any instances of non-compliance, and automatically remediate those non-compliant computers. Policy Commander is a solution that significantly reduces the complexity, time, and effort to package, test, deploy, monitor and enforce any security policy on any Windows-based server or workstation located anywhere in your network worldwide.

Appendix A contains a chart that describes the security policies contained in the Policy Commander Security Policy Knowledge Base.

To download a full Policy Commander Evaluation version please visit the New Boundary website: <http://www.newboundary.com/products/policycommander/index.htm>

3.0 New Boundary Technologies Lockdown Security Guide

The purpose of this guide is to show how Policy Commander can easily and quickly lock down Windows XP workstations and servers through application of the proven NIST Specialized Security-Limited Functionality template. This NIST template modifies several key policy areas of a Windows XP system, including password policy, account lockout policy, auditing policy, user rights assignment, system security options, event log policy, system service settings, and file permissions. The template is based on security templates previously developed by the National Security Agency (NSA), Defense Information Systems Agency (DISA), and Microsoft. Most of the settings (198) in the template represent consensus recommendations as proposed by various security experts from the Center for Internet Security (CIS), DISA, NSA, Microsoft, and NIST.

While NIST has developed different template settings for use in SOHO, Legacy, Enterprise and High Security environments, NIST has recommended that any company that has to comply with the regulatory security requirements such as HIPAA and SOX should look at using the XP Specialized Security-Limited Functionality template discussed in this guide. Therefore, New Boundary Technologies recommends that any workstations that are targeted to be locked down should use or be migrated to the Windows XP operating system. This will not only provide the highest level of security but significantly ease the task of testing, applying and maintaining the Specialized Security-Limited Functionality template for Windows XP.

3.1 High Security or Lockdown Environment

A high security or lockdown environment is any environment, networked or standalone, which is at high risk of attack or data exposure. This environment encompasses computers that contain highly confidential information (e.g., personnel records, medical records, financial information) and perform vital organizational functions (e.g., accounting, payroll processing, air traffic control). These computers might be targeted by third parties for exploitation, but also might be targeted by trusted parties inside the organization. A high security environment could be a subset of a SOHO or Enterprise environment. For example, three desktops in an enterprise environment that hold confidential financial or customer data could be thought of as a high security environment within an enterprise environment. In addition, a laptop used by a mobile worker might be a high security environment within a SOHO environment. A high security environment might also be a self-contained environment outside any other environment – for instance, a government security installation dealing in sensitive data.

Systems in high security or locked down environments face threats from both insiders and external parties. Because of the risks and possible consequences of a compromise in a high security environment, it usually has the most functionality restrictive and secure configuration. The suggested configuration provides the greatest protection at the expense of ease of use, functionality, and remote system management. In a high security environment, this guide is targeted at experienced security specialists and seasoned system administrators who understand the impact of implementing these strict requirements.

3.2 Best Practices for Analysis and Testing of Security Policies

Although the NIST security settings have undergone considerable testing and are recommended for companies looking to achieve the highest security configuration, every system and environment is unique, so system administrators should perform their own testing. The development of the NIST Windows XP Specialized Security-Limited Functionality Template was driven by the need to create a more secure Windows XP workstation configuration. Because some settings in the templates may reduce the functionality or usability of the system, it is not recommended that the complete template be used as a baseline security configuration. Specific settings in the templates should be modified as needed so that the settings conform to local policies and support required system functionality. New Boundary Technologies strongly recommends that organizations fully test the security policies contained in Policy Commander on representative systems before widespread deployment. Some lockdown settings may inadvertently interfere with applications, particularly legacy applications that may require a less restrictive security profile. The value of Policy Commander is that it was designed to provide administrators with the flexibility and power to create tailored lockdown security configurations for their unique network needs and architectures.

New Boundary Technologies recommends the following steps be taken to test the policies:

1) **Analyze:** Conduct a risk assessment of the assets in your network. Use Policy Commander as part of the risk assessment to compare the current security policies of the local workstation/servers to the policies required to meet the high security standards.

2) **Test:** When new security settings or policies are applied, they can interfere with the operation of existing software applications and other operations on the target computers. We strongly recommend testing each new policy thoroughly in the test environment before moving it to the production environment.

- 2.1 System administrators build their systems from a clean formatted state to begin the process of securing Windows XP workstations.
- 2.2 The installation and test process should be performed on a secure network segment or off the organization's network until the security configuration is completed.
- 2.3 All patches, service packs, hotfixes and rollups for XP are applied.
- 2.4 All desktop or server applications are installed, operational and have all upgrades/patches applied.
- 2.5 Strong passwords are set for all accounts.

3) **Assign:** Use Policy Commander to install the Security Policy modules in the test mode.

In the past, network administrators would have to apply the entire template and then spend hours troubleshooting the 198 settings to see which ones caused a problem on the test workstation. By reducing those 198 settings to a more manageable number of key policies, network administrators now can individually apply each policy, modify it if necessary, and then add the next policy. This will significantly decrease the time to test and configure the High Security Configuration that best fits your environment. Administrators will realize additional time saving from Policy Commander's unique ability to precisely target security policies to the appropriate computers or groups of computers.

The NBT Security Policies are organized based on the 9 categories identified by NIST. Those categories are:

- 1) Account Policies
- 2) Local Policies
- 3) Event Log Policies
- 4) Restricted Groups
- 5) System Services
- 6) File Permissions
- 7) Registry Permissions
- 8) Registry Values
- 9) File and Registry Auditing

Appendix A provides overview of these nine categories and which NBT Security Policies are in each category. Appendix B provides you with links to multiple security resources.

4) **Enforce:** Save final security configuration baseline, use Policy Commander to organize your key workstations and servers that will be locked down, and then deploy the Lockdown Security Configuration Baseline. New Boundary Technologies recommends that the automatic enforcement feature be utilized to ensure complete 24x7 enforcement of your lockdown configuration.

For a complete overview of how Policy Commander works download the 30 day evaluation at: <http://www.newboundary.com/products/policycommander/index.htm>.

4.0 Summary of Recommendations

- Protect each system based on the potential impact to the system of a loss of confidentiality, integrity, or availability.
- Reduce the opportunities that attackers have to breach a system by limiting functionality according to the principle of least privilege and resolving security weaknesses (i.e. lockdown).
- Select security controls and policies that provide a reasonably secure solution while supporting the functionality and usability that users require.
- Use multiple layers of security so that if one layer fails or otherwise cannot counteract a certain threat, other layers might prevent the threat from successfully breaching the system.
- Conduct risk assessments to identify threats against systems and determine the effectiveness of existing security controls in counteracting the threats. Perform risk mitigation to decide what additional measures (if any) should be implemented.
- Document procedures for implementing and maintaining security controls. Maintain other security-related policies and documentation that affect the configuration, maintenance, and usage of systems and applications, such as acceptable use policy, configuration management policy, and IT contingency plans.
- Test all security controls, including the settings in the NIST security templates, to determine what impact they have on system security, functionality, and usability. Take appropriate steps to address any significant issues.
- Monitor and maintain systems on a regular basis so that security issues can be identified and mitigated promptly. Actions include acquiring and installing software updates, monitoring event logs, providing remote system administration and assistance, monitoring changes to OS and software settings, protecting and sanitizing media, responding promptly to suspected incidents, performing vulnerability assessments, disabling and deleting unused user accounts, and maintaining hardware.

Appendix A

New Boundary Technologies Lockdown Security Policies

This chart describes the security policies authored by New Boundary Technologies based on setting recommendations contained in the Windows XP High Security Template. These policies are organized into nine key security categories based on the National Institute of Standards and Technology (NIST) Special Publication 800-68, *Guidance for Securing Microsoft Windows XP Systems for IT Professionals: A NIST Security Configuration Checklist*. The New Boundary Technologies policies contain the recommended settings from the NIST XP High Security Template but also include custom policies developed by NBT to meet unique security requirements not achievable using Microsoft Active Directory and Group Policies.

Security Categories	Policy Commander Policies
1.0 Account Policies	<ul style="list-style-type: none"> • Harden account lockout settings
2.0 Local Policies 2.1 Audit Policies 2.2 User Rights Assignment 2.3 Security Options	<ul style="list-style-type: none"> • Control the System Audit Policy settings • Harden the User Rights Assignment settings • Disable the Guest Account • Limit local account use of blank passwords to console only • Harden Device settings • Harden Domain Member settings • Harden Interactive Logon settings • Harden Microsoft network server settings • Harden network access settings • Harden network security settings • Harden Recovery Console settings • Harden Shutdown settings • Enforce FIPS Certified Cryptography • Harden System Objects settings • Shut down immediately if unable to log security audits • Disallow anonymous SID_Name translation • Force logoff when logon hours expire
3.0 Event Log Policies	<ul style="list-style-type: none"> • Control Event Log settings
4.0 Restricted Groups	<ul style="list-style-type: none"> • Remove all users from the Remote Desktop Users and Power Users groups.
5.0 System Services	<ul style="list-style-type: none"> • Alerter • Clipbook • FTP Publishing • HS Admin Service • Messenger • NetMeeting Remote Desktop Sharing • Routing and Remote Access • Simple Mail Transfer Protocol (SMTP) • Simple Network Management Protocol (SNMP) Service • SNMP Trap

	<ul style="list-style-type: none"> • Telnet • World Wide Web Publishing Services • Computer Browser • Remote Registry • Task Scheduler • Terminal Services • Fax Service • Indexing Service • Remote Desktop Help Session Manager • Universal Plug & Play Device Host • Netlogon
6.0 File Permissions	<ul style="list-style-type: none"> • Harden security permissions for critical files
7.0 Registry Permissions	<ul style="list-style-type: none"> • Harden security permissions for critical registry keys
8.0 Registry Values 8.1 Debugging 8.2 Automatic Functions 8.3 Networking	<ul style="list-style-type: none"> • Disable the Dr. Watson debugger and memory dump file • Disable automatically running CD-ROMs • Disable automatic administrator logon • Disable automatic reboot • Strengthen miscellaneous networking settings • Harden the Microsoft TCP/IP stack settings
9.0 Custom NBT Policies 9.1 Automatic Logoff 9.2 Sensitive File Protection 9.3 USB Removable Device	<ul style="list-style-type: none"> • Policies that address unique infrastructure requirements • Policy that can be set to automatically log off a user after a set time limit. • Policies that can restrict access to files or folders that contain sensitive or classified information to only those with authorized access. • Policies that will prevent the attachment and/or use of portable USB storage devices.
